

Model 1: Per-Plot B-Spline Smoothing of Grain-Fill

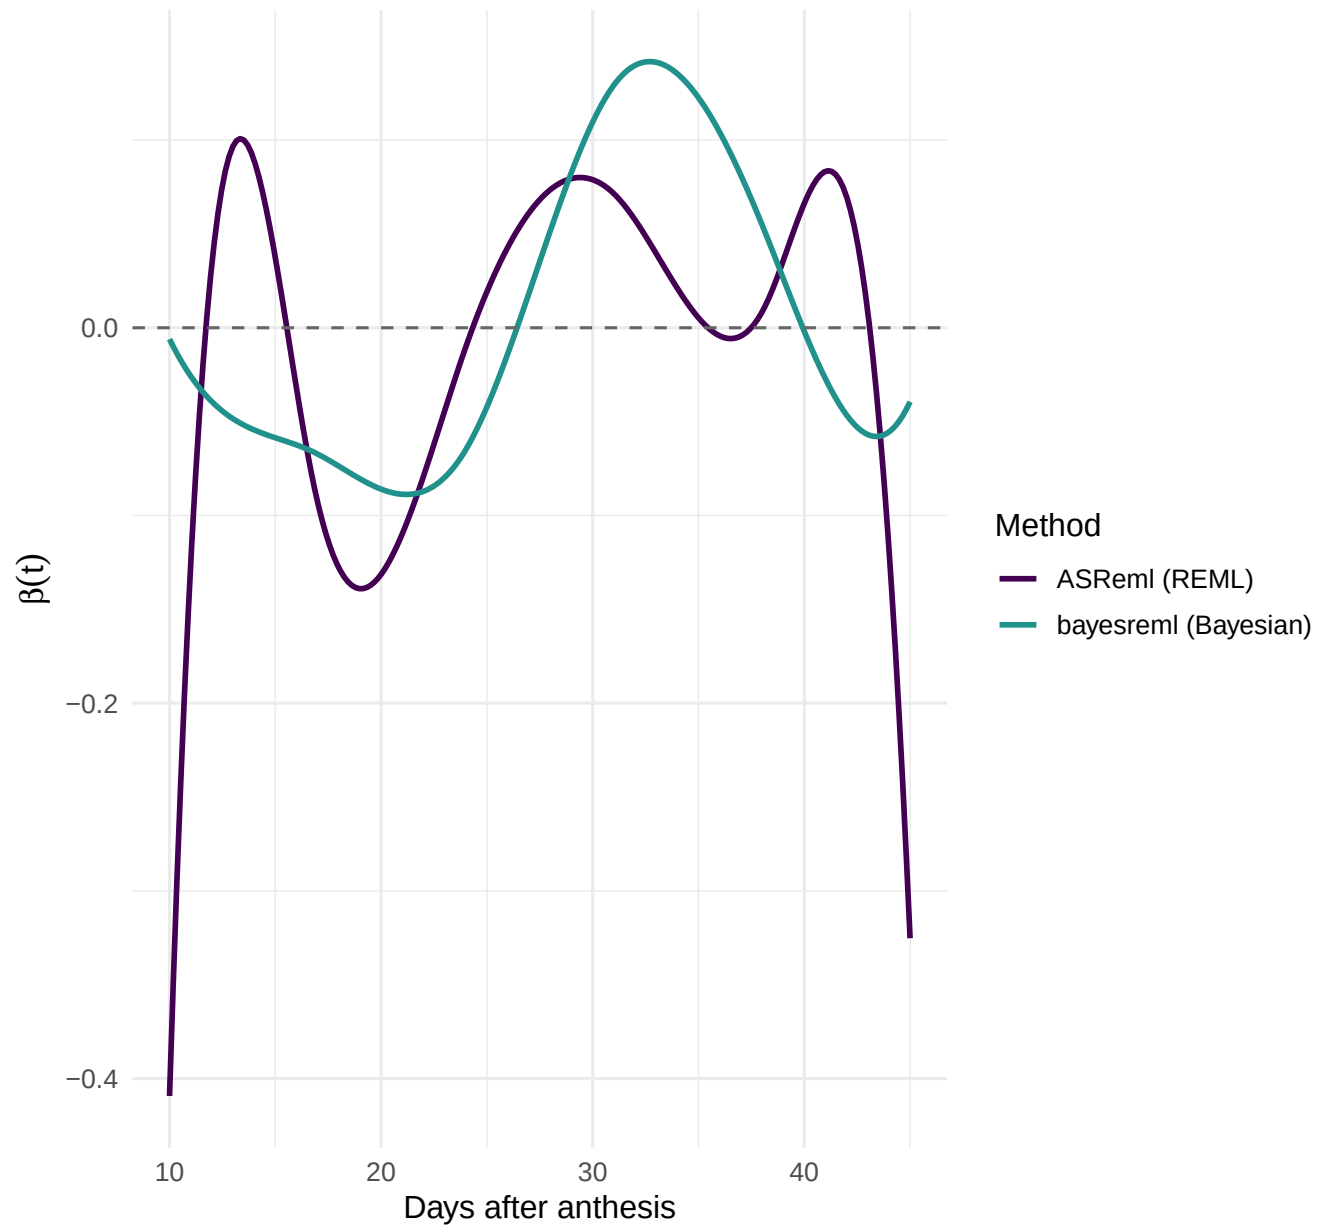

Model 2: Variety-Specific Grain-Fill Curves (ASReml)

Dashed = population mean; solid = variety curve

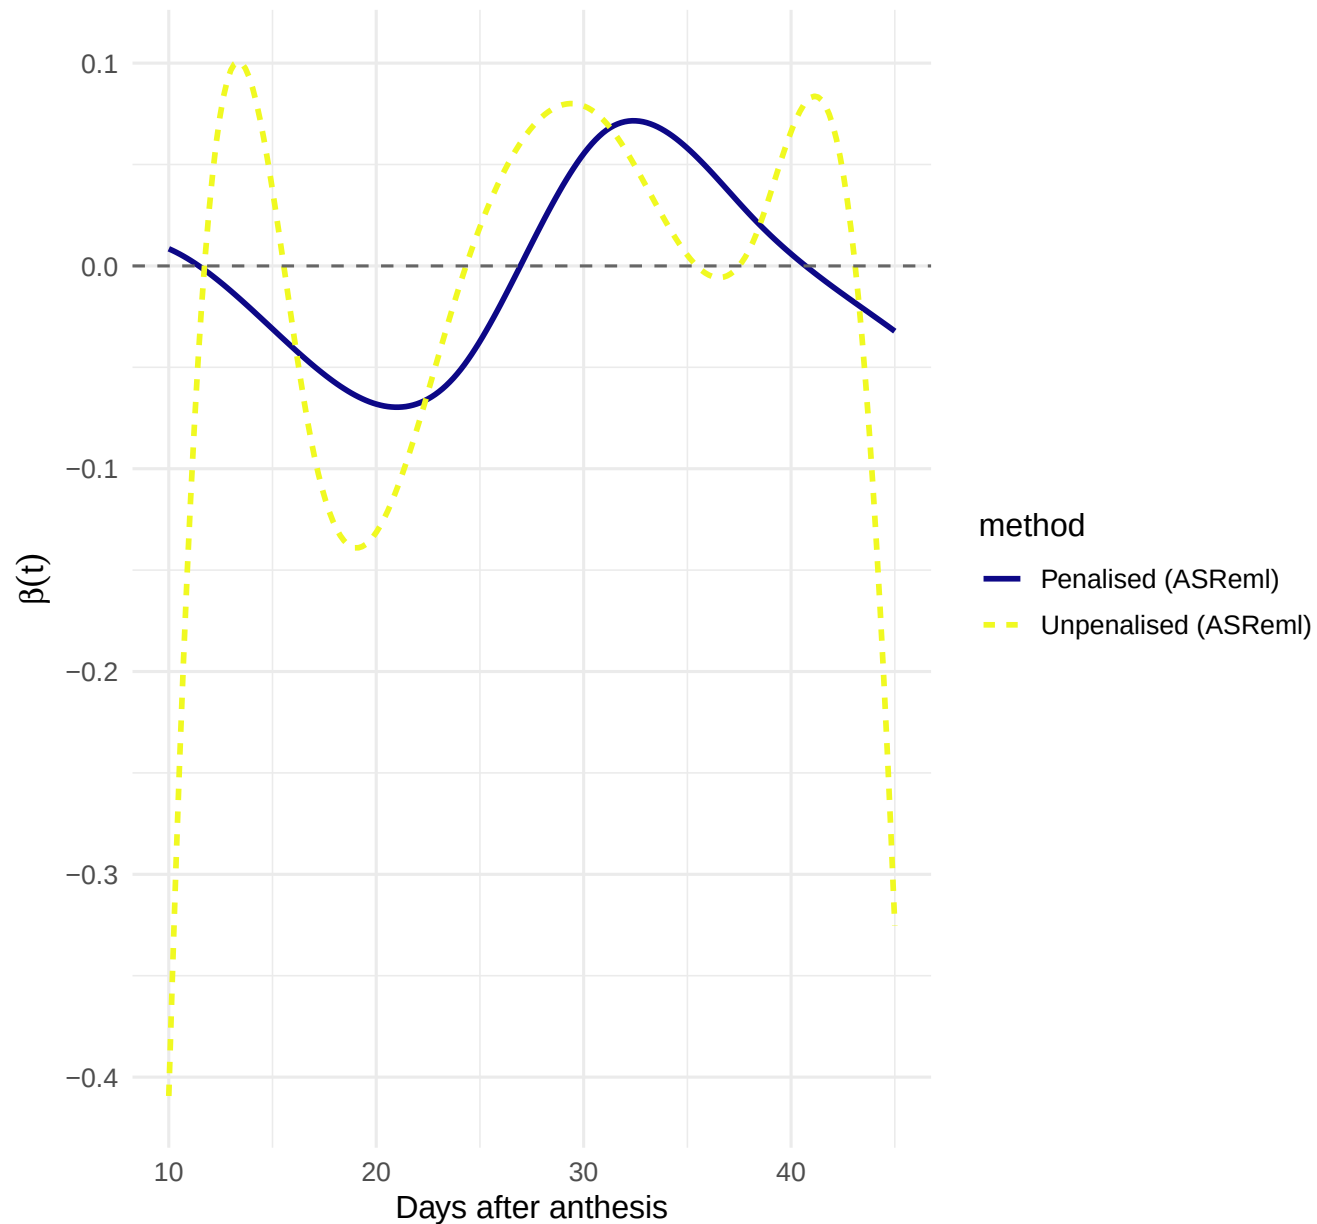

Model 3: Coefficient Function $\beta(t)$

How each phase of grain-fill influences yield

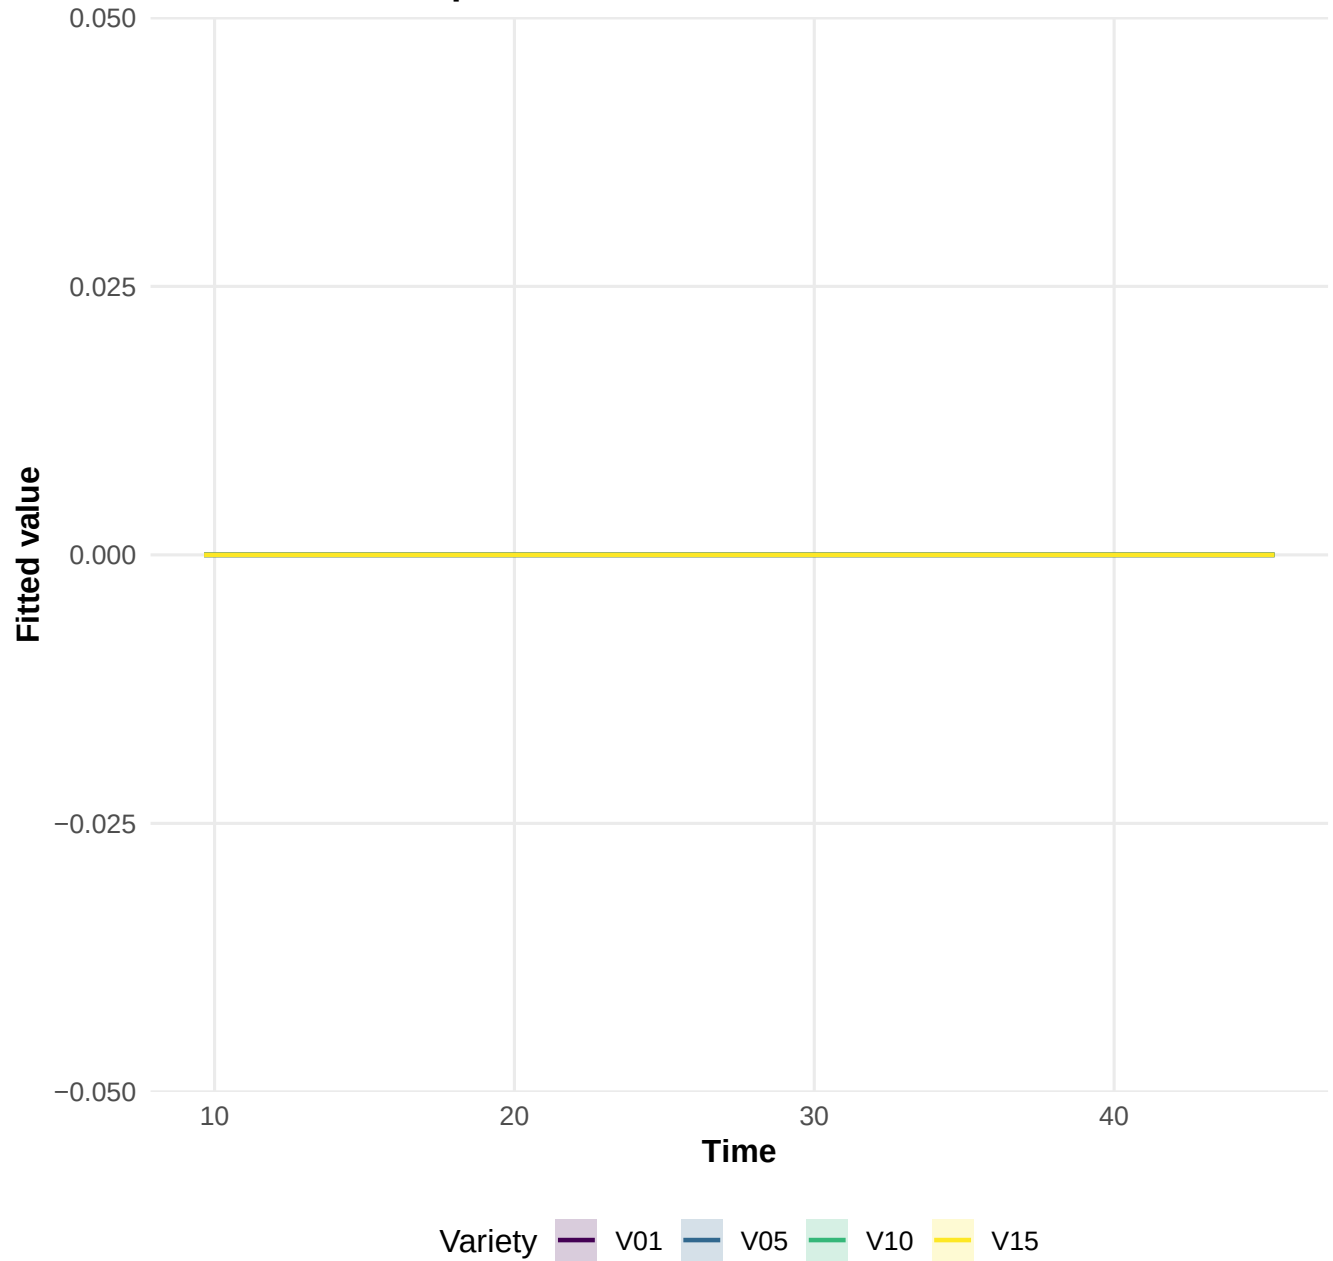

Model 4: Penalised vs Unpenalised beta(t)

Penalty smooths out spurious wiggles

Fitted functional profiles

Coefficient function

Engine: bayesreml
